OBJECTIVE

Music is an instant mood lifter. It touches the soul and helps you connect with people. It heals one's mind. Music takes care of mental needs. It helps in overcoming disabilities of any form.

There are many genres of music like classical, blues, rock, jazz, folk, etc. Every culture has its own music. The classical music in Indian culture is Carnatic and Hindustani. Whatever be the genre, it is all equally soothing.

Music is a vital part of different moments of human life. It spreads happiness and joy in a person's life. Music is the soul of life and gives immense peace to us. In the words of William Shakespeare:

"If music is the food of love, play on, Give me excess of it; that surfeiting, the appetite may sicken, and so die."

Thus, Music helps us in connecting with our souls or real self.

In our project we created a MUSIC RECOMMENDATION SYSTEM, which helps us to choose the desired songs based on our MOOD. The front end of our project is made with the help of HTML, CSS and Bootstrap framework. Here it provides with few emojis those relate our mood.

DEPRESSED

LOVE

Clicking on a particular emoji, takes us to back end of our project that is done using MySQL and connected using php. Here a list of songs of that particular mood with their links are displayed in a tabular manner with the help of tables created by MySQL.

Clicking on the link, you can go to the desired song and play and enjoy it!!!

FEATURES IMPLEMENTED

The following features have helped our project.

DDL

We used it to create different tables for creating the list of songs. We used alter table statement to add, delete, and modify the columns in the tables. We used drop as a precaution for clearing the pre-existing tables having same name.

<u>Sign Up</u>: We used a table Project_user, which takes details from the users i.e. userid, username, password, mobile_number. It also allows to choose a particular subscription which user can choose based on his/her usage.

DML

We used insert option to give inputs to each entity in a table

DQL

We used select option to showcase the values present in the table.

TRIGGERS (Optional)

We used triggers to **classify** the song type based on duration i.e. if the song is less than 2mins we defined it as a 'short' song; if it is between 2-4mins it is defined as a 'medium' song; above 4mins it is a 'long' song.

CONNECTIONS

We used php to connect our front-end & back-end of our project.

DATABASE TABLES

```
mysql>
        create table happy
            (songname varchar(30) primary key not null,
             moviename varchar(30),

LIMITATIONS

Actually we thought of using Blob datatype to store the required mp3 files. But there were many issues to retrieve it in our code. So for playing the song(s) the user has chosen, we took help from a different online source,

WYNK (https://wynk.in/music).
